Performance-driven Senior Software Engineer with over 5 years of experience in designing and deploying scalable Java Fullstack solutions. Expert in Spring Boot, Microservices architecture, and ReactJS. Proven track record in the banking and insurance sectors, delivering high-accuracy systems through Agile and DevOps practices. Adept at bridging the gap between robust backend logic and interactive frontend interfaces.

Work Experience

Senior Software Engineer

Accenture / 03/2026 - Present

- **Application Modernization:** Successfully decoupled legacy monolithic services into independent Spring Boot microservices, significantly improving overall system resilience, fault tolerance, and deployment velocity.
- **Advanced Architecture Implementation:** Applied the Saga design pattern to orchestrate distributed transactions, ensuring seamless rollback mechanisms and data consistency across decentralized databases without relying on traditional locking.
- **Event-Driven Integration:** Configured and integrated Apache Kafka to handle real-time messaging and event streaming between modernized banking modules, eliminating synchronous bottlenecks.
- **API Security & Optimization:** Developed robust, secure RESTful APIs for client-facing and internal communications, focusing on optimized payload delivery, strategic data pagination, and strict access controls.

Senior Associate Consultant

Infosys Limited / 05/2024 - 02/2026

- Designed and developed scalable Spring Boot microservices using Spring Data JPA and Hibernate to manage complex enterprise payroll workflows.
- Collaborated on Java-based applications using Apache Kafka for real-time data streaming and asynchronous message brokering.
- Enhanced frontend interactivity by integrating ReactJS components with RESTful backend services, ensuring a seamless user experience.
- Optimized data retrieval and system performance by 35% through advanced SQL query optimization and strategic pagination.
- Actively participated in the full SDLC, from API design using NETCONF/RESTCONF to deployment in containerized environments.

System Engineer

Tata Consultancy Services Limited / 10/2020 - 05/2024

- Engineered Spring Boot microservices for insurance clients following Domain-Driven Design (DDD) principles.
- Developed and maintained RESTful APIs to integrate third-party IoT devices, expanding product compatibility.
- Implemented ReactJS for internal dashboards, facilitating better data visualization for cross-functional teams.
- Streamlined CI/CD pipelines using Git, Jenkins, and Maven, reducing time-to-market by 20%.
- Ensured 90%+ code coverage through rigorous unit and integration testing using JUnit and Mockito.

Education

BCA

Aryabhatta Knowledge University / 08/2017 - 09/2020

Patna

Graduated with a CGPA of 7.29.

Projects

Business Network Controller (BNC) Modernization

05/2024

Infosys Limited

Led the development and modernization of the Business Network Controller (BNC), a critical legacy application responsible for managing Verizon's network services. The project involved working on the existing monolithic application built on the OpenDaylight (ODL) framework and subsequently leading its migration to a Spring Boot microservices architecture. The goal was to decouple the Northbound (client-facing) and Southbound (network-facing) communication layers to improve scalability, maintainability, and deployment velocity.

Key Responsibilities & Achievements:

- Designed and maintained network data models using YANG, defining the schema for network configurations and operational data.
- Utilized automated code generation tools (Maven builds) to generate service classes, driver classes, and POJO/Bean classes from YANG models, ensuring consistency between the model and the codebase.
- Implemented the business logic in the Service Implementation Layer, handling core network functions for the legacy system.
- Managed the monolithic application's dual communication responsibilities: handling Northbound APIs (for client interactions) and Southbound APIs (for communicating with physical/virtual network devices using protocols like NetConf and RestConf).

Legacy System Modernization

10/2020 - 05/2024

Tata Consultancy Services Limited

Architected and developed a scalable microservices-based ecosystem for an insurance client to modernize legacy data ingestion pipelines. The solution integrated third-party IoT devices with core insurance processing systems by implementing Domain-Driven Design (DDD) principles, enabling real-time data processing, improved product compatibility, and enhanced operational visibility.

Key Implementations & Contributions:

- Engineered high-performance Spring Boot microservices following Domain-Driven Design (DDD) patterns, including tactical patterns like Aggregates, Value Objects, and Domain Events to ensure clean separation of business logic and bounded contexts.
- Designed and implemented RESTful APIs using a contract-first approach, facilitating seamless integration with diverse IoT devices (telematics, health monitors, property sensors) and enabling real-time policy adjustments based on behavioral data.
- Implemented event-driven communication between microservices using message brokers, ensuring loose coupling and reliable data propagation across the ecosystem.
- Led the decomposition of monolithic legacy systems into distinct bounded contexts (Policy Management, Claims Processing, IoT Data Ingestion, Risk Assessment), significantly improving maintainability and development velocity.
- Developed interactive internal dashboards using ReactJS with real-time data visualization libraries, enabling claims adjusters and underwriters to monitor IoT device telemetry, detect anomalies, and make data-driven decisions.
